RECEIVED
JUN 20 1988

Dear Sir,

We are interested in addressing a grant request to the Council for Tobacco Research.

For more than ten years, we have been involved in the study of Lewis lung carcinoma, an animal model of lung cancer.

The Lewis lung carcinoma is known as a metastasizing tumor, a characteristic relevant to human lung cancer.

The efficiency of metastatic disease treatment is still extremely disappointing.

During recent years, we have been involved in the search for new treatment modalities, which might be suitable also for late stages of tumor progression. We have tried to use the membrane as a pharmacological target. We are using membrane acting substances, both as single agents as well as in combination with chemotherapeutic substances, with the aim of augmenting their cytotoxic effects. These studies have mainly been performed on variants of malignancy of AKR lymphoma and B16 melanoma.

In the project which we wish to submit to the Council for Tobacco Research, we would like to study similar therapeutic modalities on the Lewis lung carcinoma, at different stages of its development.

We would be grateful to you if you would send us the application forms for the grants of the Council for Tobacco Research.

Thanking you in advance,

Sincerely yours,

Judith Leibovici
